B.C. INTER-PROFESSIONAL PALLIATIVE SYMPTOM MANAGEMENT GUIDELINES

Copyright © BC Centre for Palliative Care. 2017. 300-601 Sixth St. New Westminster, B.C. V3L 3C1. office@bc-cpc.ca – please see Introduction section for details and disclaimer
CONSTIPATION
**DEFINITION**

**Constipation** is the difficult passage of stools, less frequent than normal for the individual.\(^1,3\) It includes straining, a sensation of incomplete evacuation, and stool consistency that ranges from small, hard lumps to a large bulky mass. It may cause discomfort or pain.\(^2,4,6,8\) **Diarrhea** is the passage of 3 or more loose stools a day, with urgency. Careful clarification is required to determine diagnosis since reports of diarrhea may include: as a single loose stool, frequent small stools, fecal incontinence, or liquid bypassing due to impaction.\(^9,13\)

**PREVALENCE**

Constipation is a significant problem in the palliative care population\(^14,15\) affecting 41% of non-cancer patients,\(^16\) 30-50% of patients with cancer,\(^17-19\) and 35-70%, and as high as 87-90\%\(^6,20\) of patients using opioids.\(^21-27\) It is more common in women and affects 24-50% of the elderly.\(^28-40\) Constipation increases as normal overall function decreases and burden of disease increases.\(^41\) **Diarrhea** is not common in palliative care, affecting less than 10% of cancer patients admitted to hospice or hospital.\(^10\)

**IMPACT**

Constipation causes significant suffering through physical symptoms such as abdominal distention, anorexia, nausea and vomiting, halitosis, abdominal and rectal pain, as well as psychological distress leading to headaches, agitation\(^80\) and delirium.\(^1\) Up to 1/3 of patients modify opioid use to avoid constipation.\(^42-45\) In older adults, constipation is associated with fecal impaction and/or fecal incontinence,\(^46\) which may be mistaken as diarrhea. This is an embarrassing, distressing and exhausting symptom for both the patient and family, and impacts dignity, mood and relationships.\(^5,9,10\) Fecal impaction can also cause urinary retention,\(^47-49\) painful fissures, ulceration, bleeding and anemia.\(^5\)
CONSTITUTION

STANDARD OF CARE

Step 1 | Goals of care conversation

Determine goals of care in conversation with the patient, family and inter-disciplinary team. Refer to additional resources (Additional resources for management of constipation) for tools to guide conversations and required documentation. Goals of care may change over time and need to be reconsidered at times of transition, e.g., disease progression or transfer to another care setting.

Step 2 | Assessment

Constipation Assessment: Using Mnemonic O, P, Q, R, S, T, U and V

<table>
<thead>
<tr>
<th>Mnemonic Letter</th>
<th>Assessment Questions 1, 3, 6, 9, 10, 14, 15, 50, 51</th>
<th>Whenever possible, ask the patient directly. Involve family as appropriate and desired by the patient.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Onset</td>
<td>When did it begin? How long does it last? How often does it occur? When was your last bowel movement?</td>
<td></td>
</tr>
<tr>
<td>Provoking /Palliating</td>
<td>What brings it on? What makes it better? What makes it worse? What is your appetite like? How is your daily intake of food and fluids? How is your mobility? Do you need help to the bathroom/commode? When toileting? Do you have enough privacy? Do you have pain or any other problems?</td>
<td></td>
</tr>
<tr>
<td>Quality</td>
<td>What is your normal bowel pattern? Are your bowel movements (BM) less frequent than usual? What do the stools look like? Are they smaller or harder than usual? Do you have discomfort or strain when passing stool? Is there controllable urge or sensation, prior to BM? Are you able to empty you bowels completely when desired? Do you have stool leakage or incontinence?</td>
<td></td>
</tr>
<tr>
<td>Region/Radiation</td>
<td>Not applicable</td>
<td></td>
</tr>
</tbody>
</table>

Constipation assessment: using mnemonic O, P, Q, R, S, T, U and V continued on next page
### Constipation Assessment: Using Mnemonic O, P, Q, R, S, T, U and V

<table>
<thead>
<tr>
<th>S (Severity)</th>
<th>How severe is this symptom? What would you rate it on a scale of 0-10 (0 being none and 10 being the worst possible)? Right now? At worst? On average? How bothered are you by this symptom? Are there any other symptom(s) that accompany this symptom?</th>
</tr>
</thead>
<tbody>
<tr>
<td>T (Treatment)</td>
<td>What medications and treatments are you currently using? Are you using any non-prescription treatments, herbal remedies, or traditional healing practices? How effective are these? Do you have any side effects from the medications and treatments? What have you tried in the past? Do you have concerns about side effects or cost of treatments?</td>
</tr>
<tr>
<td>U (Understanding)</td>
<td>What do you believe is causing this symptom? How is it affecting you and/or your family? What is most concerning to you? Do you get any other symptoms: pain, nausea/vomiting, loss of appetite, bloating, gas, blood or mucous in stools, headaches or agitation? Do you have any urinary problems? Do you have any previous trauma which may impact how we manage your bowel movements (e.g., rectal interventions may re-traumatize people with past abuse)? How can we make sure you feel safe and respected? Are you worried about incontinence?</td>
</tr>
<tr>
<td>V (Values)</td>
<td>What overall goals do we need to keep in mind as we manage this symptom? What is your acceptable level for this symptom (0-10)? Are there any beliefs, views or feelings about this symptom that are important to you and your family?</td>
</tr>
</tbody>
</table>

**Symptom Assessment: Physical assessment as appropriate for symptom**

Conduct a detailed history and physical examination, including a rectal or stomal exam. Review medications, medical/surgical conditions, psychosocial and physical environment. Differentiate fecal impaction with liquid stool bypass from diarrhea. Further investigations should be tailored to patient prognosis, goals of care, access to health-care resources, and the potential benefits of a precise diagnosis.
**CONSTITUTION**

**Diagnostics:** consider goals of care before ordering diagnostic testing

- Blood tests are rarely needed but, depending on clinical presentation, CBC, electrolytes, calcium and thyroid function should be evaluated.\(^{10, 55}\)
- If obstruction is suspected, X-ray to determine if partial or complete, high or low.\(^{10, 52, 56}\)

Step 3 | **Determine possible causes and reverse as possible if in keeping with goals of care** (For more details, see Underlying causes of constipation in palliative care)

Constipation is often multifactorial in persons with advanced disease.\(^{10, 14, 46, 57}\)

Predisposing risk factors are many (see Underlying causes of constipation in palliative care); most common include: older age, reduced intake, immobility, advanced disease, and use of anticholinergic and/or opioid medications.\(^{10, 57, 58}\)

Opioids are a significant, but not exclusive, cause of constipation\(^{41}\); therefore, focus should be broader than this single cause.\(^{57}\)
PRINCIPLES OF MANAGEMENT

When considering a management approach, always balance burden of a possible intervention against the likely benefit (e.g., does the intervention require transfer to another care setting?)

- Prevention of constipation is key when risk factors exist (e.g., opioids, decreased intake, decreased physical activity).
- Increase and monitor fluids, dietary fibre, and physical activity, as tolerated.\(^6, 10, 50\)
- Identify and correct modifiable risk factors.\(^6, 7, 10, 59\)
- Discontinue fiber in debilitated patients if unable to maintain hydration, or when bowel obstruction is suspected.\(^3, 52\)
- Anticipate constipating effects of opioids and ensure a prophylactic laxative\(^15, 60\) unless bowel obstruction or diarrhea.\(^1, 41, 55, 59-61\)
- Oral measures are preferred and reduce need for rectal interventions.\(^2, 10\)
- Regularly monitor bowel pattern and patient satisfaction to adjust to desired effect.\(^1, 7\)
- Use practice tools to improve management: checklists, laxative protocols, audits.\(^2, 3, 59, 62-64\)
- Involve interdisciplinary team.\(^59\) Consider personal, psychosocial and cultural perspectives.\(^6\)
- Constipation is often progressively more challenging over time in end-of-life patients.
LEGEND FOR USE OF BULLETS

Bullets are used to identify the type or strength of recommendation that is being made, based on a review of available evidence, using a modified GRADE process.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>✔️</td>
<td>Use with confidence: recommendations are supported by moderate to high levels of empirical evidence.</td>
</tr>
<tr>
<td>🏡</td>
<td>Use if benefits outweigh potential harm: recommendations are supported by clinical practice experience, anecdotal, observational or case study evidence providing low level empirical evidence.</td>
</tr>
<tr>
<td>🚫</td>
<td>Use with caution: Evidence for recommendations is conflicting or insufficient, requiring further study</td>
</tr>
<tr>
<td>✗</td>
<td>Not recommended: high level empirical evidence of no benefit or potential harm</td>
</tr>
</tbody>
</table>

Non-pharmacological interventions

Interventions available in the home and residential care facilities

It may be possible to manage constipation in the home or residential care facility with appropriate planning and support for the patient, family and staff; all of these interventions do not necessarily require additional equipment or admission to acute care.

- Encourage hydration, fibre intake and mobility, as tolerated\(^1\)\(^3\),\(^14\),\(^52\),\(^82\)
- Wheat bran and prunes improve bowel function,\(^64\) as tolerated.
- Refer to physiotherapy and/or OT for appropriate exercise and mobility supports\(^10\) as immobility may be more constipating than opioids.\(^14\),\(^59\),\(^83\)

Non-pharmacological interventions continued on next page
Non-pharmacological interventions continued

- **Biofeedback training** with physiotherapist may also benefit.65
- **Avoid use of bedpans.**14, 84 Ensure privacy, personal preference, promote independence and convenience during toileting.3, 52, 69, 85, 86

⚠️ There is little or no empirical evidence for other complementary approaches.10

⚠️ Probiotics, have some evidence of benefit in constipation,80 but may also harm.87 Avoid use in severely ill or immunocompromised patients.88

Pharmacological interventions

**ORAL LAXATIVES ARE FIRST-LINE THERAPY FOR CONSTIPATION**

**Recommended first-line oral laxatives: Sennosides, Lactulose, Polyethylene Glycol**

- Effectiveness of each appears similar based on expert opinion79, 89; therefore, seek patient preferences.10, 15, 90, 91 Other factors impacting selection will include: cost, patient performance status, tolerance to effects, and ability to swallow.2, 3, 58 See Medications for management of constipation for more information about medications for management.

- **Opioid-induced constipation (OIC):** the constipating effects of opioids are persistent. When opioids are started, prophylactic laxatives are usually required, and should be continued for the duration of opioid use.15, 60

- **Sennosides may be the most useful single laxative when an opioid is prescribed.**6, 10, 52, 63, 90, 92, 93

- A combination of a stimulant (e.g., sennosides), plus an osmotic laxative to moisturize and to soften stool (e.g., lactulose or polyethylene glycol (PEG)) may be required, particularly for opioid-induced constipation.2, 6, 15, 60, 62

- Use a stepwise approach, starting with simple, economical laxatives.14 See the Constipation and bowel obstruction management algorithm.

Pharmacological interventions continued on next page
Pharmacological interventions continued

### Titration of Oral Laxatives

- Titrate laxative doses **every 1 to 2 days** according to response.\(^{10, 15, 59}\)
- Once current regimen satisfactory and well tolerated, continue with it, reviewing regularly with the patient; explain importance of preventing constipation.\(^1\)
- As the dose of opioids increases, the dose of laxatives often needs to increase, with dosing twice daily (breakfast/bedtime) or even three times daily,\(^6, 90\) up to the maximum recommended or tolerable.\(^{15, 90, 94, 95}\)
- The proportional dose of stimulant versus osmotic laxative is guided by stool consistency and tolerance.
  
  **If faecal leakage:** reduce the dose of the osmotic laxative.\(^2, 90\) **If colic** (usually alongside hard stools): increase the osmotic laxative relative to the stimulant,\(^2\) and/or divide the total stimulant daily dose into smaller, more frequent doses.\(^63\)
- Evaluate patient tolerance and adverse effects from laxatives. Refer to Constipation and bowel obstruction management algorithm.
- Resolve diarrhea from laxatives by holding drugs for 1 to 2 days; restart at a lower dose.\(^96\)
- Stop oral laxatives in the last few days of life when patients are no longer able to receive medication and their level of consciousness diminishes. Rectal care then is rare.\(^2, 59, 96\)

### Use of Rectal Measures: When Standard Oral Laxatives are Unsuccessful

Rectal Interventions (suppository, enema, manual extraction) should be used infrequently.\(^6\) See Constipation and bowel obstruction management algorithm and Constipation and bowel obstructions extra resources or assessment tools for further rectal measures information.

*Pharmacological interventions continued on next page*
Refractory Constipation: When Standard Optimum Oral and Rectal Measures are Unsuccessful

- Consult a palliative care specialist for refractory opioid-induced constipation or for specific, complex patient needs including spinal cord compression and cognitive impairment.2, 59

- When OIC suspected, and response to other standard measures is inadequate, opioid antagonists (e.g., methylnaltrexone, naloxegol) may be suitable with specialist advice.2 Use only after failure of standard laxative therapy, to augment, not replace laxatives.63 See Constipation and bowel obstruction management algorithm for more information.97, 98

Patient and family education

- Explain normal bowel function; this varies from person to person.67
- A daily bowel movement is not necessary. As long as stools are soft and easy to pass,68, 69 every 2 to 3 days is acceptable.70,71
- Don’t ignore the urge to have a bowel movement. Try within 30 to 60 minutes following a meal, when the gastro colic reflex commonly occurs.11, 72-74
- Avoid excess straining as this may be harmful in some medical conditions.11, 64, 72
- Toilet in sitting position with use of a raised toilet seat, foot stool or bedside commode.
- Privacy during toileting11, 13, 22, 72, 73, 75, 76 helps reduce anxiety/aids relaxation.
- Advance pain control helps improve comfort and mobility.11, 64, 72
- Teach how to differentiate between oozing stool and diarrhea.

Teach constipation prevention

- Increase fluids, dietary fibre, and mobility as tolerated; this is less possible over time.
- Nutritional liquids, milkshakes, cream soups, fruit juices may aid appetite/activity.57
Patient and family education continued

- A fruit laxative can be made with prunes, dates, figs and raisins.70, 72
- When oral intake and mobility are reduced, avoid extra fibre.3, 11, 13, 22, 73, 75, 77, 78 A laxative may be needed.
- Patients on opioids for symptom control will need a stimulant laxative from the start of opioids to prevent ongoing constipating effects.10, 14, 25, 57, 79, 80 (Medications for management of constipation)
- Healthcare providers can help choose the laxative type most suited to individual needs.

Explain in advanced illness

- Since the body continues to produce 1 to 2 ounces of stool per day, even if no oral intake,81 a laxative may still be needed. It can be stopped in the last days of life.

<tr>
<th>Drug, Action</th>
<th>Dose, Therapeutic Range</th>
<th>Onset, Adverse Effects, Precautions and Dosing Concerns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Methylnaltrexone</td>
<td>Subcutaneous injection every 2 days as needed. Dose is weight based: 33-37 kg = 6 mg 38-61 kg = 8 mg 62-114 kg = 12 mg 115-126 kg = 18 mg Outside these ranges, dose 0.15 mg/kg. Reduce doses by 50% when creatinine clearance is less than 30 mL/min.</td>
<td><strong>24 minutes to 4 hours.</strong> Abdominal pain, diarrhea, nausea, flatulence. Rare: flushing, delirium, severe diarrhea leading to dehydration and subsequent cardiovascular collapse, extrasystoles. <strong>Caution: Gastrointestinal (GI) perforation is a risk of this medication for patients with advanced illness</strong> such as: cancer, GI malignancy, GI ulcer, and Ogilvie's syndrome and taking medications such as bevacizumab, non-steroidal anti-inflammatory drugs and steroids. To be used in conjunction with ongoing laxative therapy when laxatives alone are insufficient for treatment of opioid-induced constipation for advanced illness palliative care patients. <strong>Stop if response inadequate after four doses.</strong> No drug interactions with cytochrome P450 metabolized drugs. Balance drug cost alongside staffing costs, patient outcomes.</td>

### Medications for Management of Constipation

**Naloxegol**  
Peripheral opioid receptor antagonist

<table>
<thead>
<tr>
<th>Drug, Action</th>
<th>Dose, Therapeutic Range</th>
<th>Onset, Adverse Effects, Precautions and Dosing Concerns</th>
</tr>
</thead>
</table>
| Naloxegol    | Usual dose: 12.5 to 25 mg PO daily  
Maximum daily dose: 25 mg PO daily | 6 to 12 hours. \(^{108}\) 50% of people respond within 12 hours.\(^{109}\)  
Naloxegol is indicated for the treatment of opioid-induced constipation in adult patients with **non-cancer pain** who have had an inadequate response to laxatives.\(^{109}\)  
Usual starting dose is 25 mg daily. Reduce to 12.5 mg daily if moderate to end-stage renal impairment or if used concomitantly with weak CYP3A4 inhibitors (e.g., cimetidine, quinidine).  
Renal patients can increase dose to 25 mg daily if the 12.5 mg dose is well tolerated.\(^{109}\)  
Abdominal pain, flatulence, headache, diarrhea, and nausea\(^{98, 109}\)  
**Anticipate numerous significant CYP3A4 drug interactions.**  
**Contraindicated in patients concomitantly receiving strong CYP3A4 inhibitors** (e.g., ketoconazole, voriconazole, clarithromycin, protease inhibitors such as ritonavir).  
Interactions also occur with P-glycoprotein transporters (P-gp) modulators.\(^{109}\) **Avoid grapefruit juice.**\(^{109}\) |

<tr>
<th>Drug, Action</th>
<th>Dose, Therapeutic Range</th>
<th>Onset, Adverse Effects, Precautions and Dosing Concerns</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Contraindicated in known or suspected GI obstruction or patients at risk of recurrent obstruction due to potential for GI perforation. Caution: if using in patients with any risk of impaired integrity of the gastrointestinal tract wall (e.g., severe peptic ulcer disease, Crohn’s Disease, active or recurrent diverticulitis, infiltrative gastrointestinal tract malignancies or peritoneal metastases), consider the overall benefit/risk profile for a given patient. When started, all current laxative therapy should be stopped until clinical effect of naloxegol is determined. Does not cause systemic opioid withdrawal symptoms. Take in the morning on an empty stomach at least 1 hour prior to the first meal of the day or 2 hours post-meal. Balance drug cost alongside staffing costs, patient outcomes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

† Off-label. PO = by mouth IV = Intravenous, SC = Subcutaneous, TID = three times daily, QID = four times daily ODT = oral dissolving tablet, CSCI = continuous subcutaneous infusion.

Prices for prescription drugs may be obtained from BC PharmaCare. The British Columbia Palliative Care Benefits Plan provides province-wide drug coverage for many of the recommended medications; check website to confirm coverage. Consider price when choosing similarly beneficial medications, especially when the patient/family is covering the cost.
CONSTIPATION AND BOWEL MANAGEMENT ALGORITHM$^{3,4,7}$

Guidelines for care

Patient taking opioids and/or reports constipation

Patient assessment history and physical

Exclude malignant intestinal obstruction

Correctable

Assessment of causes and initiate treatment of constipation

Treatment of reversible causes

Not correctable

First-line treatment with oral laxative: Combination of a stimulant and/or osmotic laxative according to patient’s needs

Continue regimen Review regularly

Not improved

Second-line treatment; Rectal suppository and if not effective, enema, unless concerns for bleeding/trauma

Consider next steps Re-assess patient status and goals Adjust oral laxatives to best effects

Not improved

Third-line treatment: If patient taking opioids consider either methylnaltrexone or naloxegol, and lastly manual evacuation

Consider next steps Re-assess patient status and goals Adjust oral laxatives to best effects

Refer to Medications for management of constipation for further drug details including precautions and contraindications. Refer to guideline sections for specifics for prevention and patient/family education and preventative strategies. Constipation and bowel obstruction references continued on next page.
