NAUSEA & VOMITING

DEFINITION

**Nausea** is the unpleasant subjective sensation of being about to vomit. It may occur in isolation or in conjunction with other gastrointestinal symptoms (e.g., vomiting)\(^1\) and/or autonomic symptoms (e.g., pallor, cold sweat, salivation).\(^2\) **Vomiting** is the forceful expulsion of the gastric contents through the mouth or nose.\(^2\)

PREVALENCE

Nausea and vomiting affects 40-60% of those receiving palliative care.\(^2\)\(^-\)\(^5\)

IMPACT

Nausea and vomiting can be profoundly distressing for both patients and families, decreasing their quality of life.\(^2\)\(^-\)\(^5\) They may also delay active treatments such as chemotherapy.

STANDARD OF CARE

**Step 1 | Goals of care conversation**

Determine goals of care in conversation with the patient, family and inter-disciplinary team. Refer to additional resources ([Additional resources for management of nausea and vomiting](#)) for tools to guide conversations and required documentation. Goals of care may change over time and need to be reconsidered at times of transition, e.g., disease progression or transfer to another care setting.

<table>

<tr>
<th>Mnemonic Letter</th>
<th>Assessment Questions <em>Whenever possible, ask the patient directly. Involve family as appropriate and desired by the patient.</em></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Onset</strong></td>
<td>When did it begin? How long does it last? How often does it occur?</td>
</tr>
<tr>
<td><strong>Provoking /Palliating</strong></td>
<td>What brings it on? What makes it better? What makes it worse?</td>
</tr>
<tr>
<td><strong>Quality</strong></td>
<td>What does it feel like? Can you describe it? Do you vomit or just feel nauseated? Does it change when you change position?</td>
</tr>
<tr>
<td><strong>Region/Radiation</strong></td>
<td>Not applicable</td>
</tr>
<tr>
<td><strong>Severity</strong></td>
<td>How severe is this symptom? What would you rate it on a scale of 0-10 (0 being none and 10 being the worst possible)? Right now? At worst? On average? How bothered are you by this symptom? Are there any other symptom(s) that accompany this symptom?</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td>What medications and treatments are you currently using? Are you using any non-prescription treatments, herbal remedies, or traditional healing practices? How effective are these? Do you have any side effects from the medications and treatments? What have you tried in the past? Do you have concerns about side effects or cost of treatments?</td>
</tr>
<tr>
<td><strong>Understanding</strong></td>
<td>What do you believe is causing this symptom? How is it affecting you and/or your family? What is most concerning to you?</td>
</tr>
<tr>
<td><strong>Values</strong></td>
<td>What overall goals do we need to keep in mind as we manage this symptom? What is your acceptable level for this symptom (0-10)? Are there any beliefs, views or feelings about this symptom that are important to you and your family?</td>
</tr>
</tbody>
</table>
NAUSEA & VOMITING

Symptom Assessment: Physical assessment as appropriate for symptom

- Assess for signs of dehydration, jaundice, infection (e.g., fever) or drug toxicity.
- Neurological exam: assess for signs of a cranial lesion or raised intracranial pressure.
- Abdominal examination: assess for tenderness, organomegaly, ascites.
- +/- Rectal examination

Diagnostics: consider goals of care before ordering diagnostic testing

Possible investigations are guided by the findings from the history and examination

- Blood work: CBC and differential, calcium, glucose, renal and liver function.
- Urine culture.
- Abdominal imaging: X-ray, ultrasound, CT/MRI.
- Endoscopy.

Step 3 | Determine possible causes and reverse as possible if in keeping with goals of care (For more details, see Underlying causes of nausea and vomiting in palliative care)

Nausea and vomiting (NV) are separate but related symptoms present in many life-limiting conditions. Gastric stasis and chemical disturbance are the most common causes but the etiology is often multifactorial and may be difficult to establish.\(^9\)

Underlying causes can be classified into 6 broad groups.\(^2,8,9\) (See Underlying causes of nausea and vomiting in palliative care for more detailed causes.)

- Chemical
- Cortical
- Cranial
- Vestibular
- Visceral or serosal
- Gastric Stasis
  (impaired gastric emptying)
PRINCIPLES OF MANAGEMENT

When considering a management approach, always balance burden of a possible intervention against the likely benefit (e.g., does the intervention require transfer to another care setting?)

- Use cause determination, knowledge of emetogenic pathways, and a structured approach to guide antiemetic selection.\textsuperscript{10, 11}

- Use the first line drug recommended for the most likely cause of the symptom. Refer to Underlying causes of nausea and vomiting in palliative care for drug selection and dosages.

- A single antiemetic is sufficient in the majority of patients.\textsuperscript{13}

- Monitor for symptom resolution and adverse effects for 48 hours. Use Management of nausea and vomiting titration algorithm to guide further steps.

- If symptoms persist, prescribe a regular antiemetic with different antiemetic to be given as needed.\textsuperscript{2, 8, 9, 14}
Non-pharmacological interventions

Non-pharmacological interventions provide their best relief for mild and moderate nausea and vomiting. In severe symptoms, their role is adjunctive to medications.

Interventions available in the home and residential care facilities

- Meticulous attention to oral care; watch for signs of oral thrush. Prevent constipation.\(^{15, 16}\)
- Keep air and room fresh; eliminate strong odors.\(^{17}\)
- Increase oral intake from ice chips, to clear fluids, to full fluids then to solid food as tolerated; Involve Clinical Dietician and/or other health disciplines as required.

Non-pharmacological interventions continued on next page
Non-pharmacological interventions continued

- **Aromatherapy**: peppermint or ginger oils reduce cancer related NV in small studies.²

Interventions requiring additional equipment or admission to acute care

- Use of acupuncture or acupressure wrist bands.¹⁵
- Offer clinically assisted hydration (IV or SC) if there is overall benefit or if functional status is high. Watch for fluid overload. Dying patients require lower volumes for hydration.⁹

Pharmacological interventions (refer to Medications for management of nausea and vomiting, Nausea and vomiting management algorithm and Nausea and vomiting extra resources or assessment tools for more detailed information)

Routes of Administration

- Oral administration is preferred.²,¹⁵ Rectal may be considered.
- Parenteral medication (IV/SC) may be considered if the patient has vomiting, suspected malabsorption or gastric stasis.²,¹⁵ After 3 days, consider converting to oral administration except in cases of mechanical intestinal obstruction.¹⁴

- When switching routes of administration (such as oral to SC or IV) consider a bioavailability dosing adjustment. See Nausea and vomiting management algorithm, and monitor response and adverse effects.

Low levels of distress (patient rating of 1 to 3/10)

- Mild levels may respond to non-pharmacological actions.
- Use the first-line drug for the most likely symptom cause. Refer to Underlying causes of nausea and vomiting in palliative care for first, second and third line drug selection.

Pharmacological interventions continued on next page
Pharmacological interventions continued

Treat regularly for 48 hours, providing an additional PRN antiemetic drug.\(^9,10,12\)

**Moderate level of distress** (patient rating of 4 to 6/10)

Select the drug based on presumed etiology.

If cause is unknown (10-25% of patients)\(^10,18\) or due to multiple factors (25-62%),\(^3,10,18,19\) initial antiemetic choices are:

- a) Metoclopramide: treats common causes of nausea, e.g., gastric stasis, partial bowel obstruction.\(^9\) **Avoid use in complete bowel obstruction.**

- b) Haloperidol: treats chemical disturbances, another common cause of nausea.

- c) Methotrimeprazine: a broad acting receptor antagonist.\(^7\)

**Severe distress** (patient rating of 7 to 9/10)

Urgently assess cause and initiate appropriate drug treatment/interventions.

If inadequate control of severe nausea and vomiting within the first 48 hours, consider further management including:

- a) Hospitalization, if required.

- b) Consultation with palliative care physician.

Further antiemetic titration drugs or options, including the combining of antiemetics which have a different or broader action, may be considered.
Non-pharmacological interventions

Refractory Nausea and Vomiting\(^\text{15}\)

- May require a consultation with a palliative care specialist.
- Prior to referral, professionals may wish to review if:
  - An appropriate antiemetic has been chosen, at optimal dose, and given by the appropriate route (often non-oral due to compromised oral absorption) for an adequate time period.\(^\text{15}\)
  - Continued vomiting is an obstruction; duodenal/gastric outflow or high small bowel.\(^\text{15}\)

Practice Points for Antiemetic Pharmacological Management

- Antiemetics tend to suppress vomiting more readily than nausea; an increase of the antiemetic dose may improve nausea control.\(^\text{18}\)
- Haloperidol and methotrimeprazine have long elimination half-lives (13-35, 15-30 hours),\(^\text{11}\) reaching steady state in about 5 days. Once or twice daily dosing frequency may then be possible to improve dosing convenience and to minimize adverse effects from accumulation.
- Combining antiemetics aims to block several, but not overlapping, emetic pathways:
  - Initially, use of a single antiemetic drug up to maximum tolerated dose is preferable.
  - Single broader spectrum drugs such as methotrimeprazine and olanzapine have affinity at many receptors and may be as effective as, and easier for patients to handle than, multiple simultaneous antiemetics; may also minimize drug interactions.\(^\text{11, 19}\)
  - When combining antiemetics, polypharmacy risks are greater, as are adverse effects such as sedation and anti-cholinergic effects; monitor for overlapping toxicities.\(^\text{20, 21}\)

*Non-pharmacological interventions continued on next page*
Non-pharmacological interventions continued

Avoid combinations with antagonistic actions as effectiveness of either is at risk:

- Prokinetic agents such as metoclopramide are potentially antagonized by anticholinergics (e.g., dimenhydrinate, scopolamine, hyoscine).2, 8, 9, 11, 12

- Use combinations with different receptor affinities, e.g., dimenhydrinate and haloperidol,11 or haloperidol with a 5HT3 receptor antagonist such as ondansetron.19

Corticosteroids may improve nausea caused by increased ICP (related to intracranial tumors), hypercalcemia of malignancy, malignant pyloric stenosis2 or visceral causes (see Underlying causes of nausea and vomiting in palliative care); may also reverse partial bowel obstructions.

Marijuana lacks controlled clinical efficacy studies; nabilone is an antiemetic alternative.1

Opioid-induced nausea lacks evidence of a preferred antiemetic choice.22 However, use of an antiemetic may help, thus increasing compliance with analgesic especially for patients sensitive to many drugs.

Nausea might be minimized by switching opioids or route of administration.22

Patient and family education

- Explain that a combination of strategies may be needed, often due to multiple triggers.1, 8

- Teach how to use non-oral medications and non-pharmacological methods.2

- Encourage patients to continue analgesic medication as pain can make nausea worse.15

- Offer tools to keep track of symptoms, medications taken and effectiveness.

† Off-label. PO = by mouth IV = Intravenous, SC = Subcutaneous, TID = three times daily, QID = four times daily ODT = oral dissolving tablet CSCI = continuous subcutaneous infusion.

*Adjust/monitor dosing in patients with renal dysfunction, avoid in complete bowel obstruction

‡QTc prolongation risk known to occur for domperidone, haloperidol, ondansetron, methotrimeprazine and is a conditional risk for metoclopramide use. Per https://credibledrugs.org/

Drug coverage and cost information available from: http://www2.gov.bc.ca/assets/gov/health/practitioner-pro/bc_guidelines/palliative2_nausea_medtable.pdf

Consult most current product monograph for full drug information and adverse effects: https://health-products.canada.ca/dpd-bdpp/index-eng.jsp

Medications...vomiting related to underlying cause continued on continued on next page
Prices for prescription drugs may be obtained from BC PharmaCare. The British Columbia Palliative Care Benefits Plan [http://www2.gov.bc.ca/assets/gov/health/health-drug-coverage/pharmacare/palliative-formulary.pdf](http://www2.gov.bc.ca/assets/gov/health/health-drug-coverage/pharmacare/palliative-formulary.pdf) provides province wide drug coverage for many of the recommended medications—check website to confirm coverage. Consider price when choosing similarly beneficial medications, especially when the patient/family is covering the cost.

**NAUSEA AND VOMITING MANAGEMENT ALGORITHM - TITRATION**

- Start first line antiemetic
- Review at 48 hours
- Effective: Continue
- Partial effect tolerated: Titrate in increments
- Not tolerated or no effect at therapeutic dose: Stop and change to second line agent
- Regular review and titration until...
  - Effective: Continue
  - Partial effect at maximum tolerated dose: Stop and switch to second line agent or combine with second line agent with different receptor profile

</table>

*Dimenhydrinate is a 53 to 56% component of diphenhydramine\(^{30}\) and the latter has a 42% oral bioavailability.\(^{14}\)

\(^\ddagger\)The need to adjust dosing is poorly studied for these antiemetics, while use of small doses may partially preclude dosing adjustments for oral to parenteral dosing.\(^{31}\) Studies to guide rationale dosage reduction when changing between oral and parenteral routes with antiemetics are lacking, however known oral bioavailability data and some expert opinion suggest that dose adjustments may need to be considered and therapy individualized.
