**DEFINITION**

Pruritus or itch is defined as an intense cutaneous discomfort occurring with pathological change in the skin and mucous membranes which elicits vigorous scratching. It is a complex symptom with poorly characterized pathophysiology and is variable in its perceived quality and intensity. It may be idiopathic or prodrome of disease.

**PREVALENCE**

Pruritus is rare but troublesome, ranging from 1% at onset of administration of opioids to 25-85% for persons with advanced renal failure. Prevalence increases with age.

**IMPACT**

Can create significant suffering and morbidity leading to sleep deprivation, depression, anxiety, impaired quality of life, and even suicidal ideation.

**STANDARD OF CARE**

**Step 1 | Goals of care conversation**

Determine goals of care in conversation with the patient, family and inter-disciplinary team. Refer to additional resources (Additional resources for management of pruritus) for tools to guide conversations and required documentation. Goals of care may change over time and need to be reconsidered at times of transition, e.g., disease progression or transfer to another care setting.
### Pruritus Assessment: Using Mnemonic O, P, Q, R, S, T, U and V31

<table>
<thead>
<tr>
<th>Mnemonic Letter</th>
<th>Assessment Questions Whenever possible, ask the patient directly. Involve family as appropriate and desired by the patient.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Onset</td>
<td>When did it begin? How long does it last? How often does it occur?</td>
</tr>
<tr>
<td>Provoking /Palliating</td>
<td>What brings it on? What makes it better? What makes it worse?</td>
</tr>
<tr>
<td>Quality</td>
<td>What does it feel like? Can you describe it?</td>
</tr>
<tr>
<td>Region/Radiation</td>
<td>Where do you feel itchy? Is it in one area or your entire body?</td>
</tr>
<tr>
<td>Severity</td>
<td>Pruritus cannot be measured directly and is difficult to quantify.4,5 Focus questions on impact on quality of life. May try questions using a rating scale: How severe is this symptom? What would you rate it on a scale of 0-10 (0 being none and 10 being the worst possible)? Right now? At worst? On average? How bothered are you by this symptom? Are there any other symptom(s) that accompany this symptom? (Existing itch measurement tools are too detailed and resource intensive for use in palliative care setting.)</td>
</tr>
<tr>
<td>Treatment</td>
<td>What medications and treatments are you currently using? Are you using any non-prescription treatments, herbal remedies, or traditional healing practices? How effective are these? Do you have any side effects from the medications and treatments? What have you tried in the past? Do you have concerns about side effects or cost of treatments?</td>
</tr>
<tr>
<td>Understanding</td>
<td>What do you believe is causing this symptom? How is it affecting you and/or your family? What is most concerning to you?</td>
</tr>
<tr>
<td>Values</td>
<td>What overall goals do we need to keep in mind as we manage this symptom? What is your acceptable level for this symptom (0-10)? Are there any beliefs, views or feelings about this symptom that are important to you and your family?</td>
</tr>
</tbody>
</table>
Symptom Assessment: Physical assessment as appropriate for symptom

Diagnostics: consider goals of care before ordering diagnostic testing.

Step 3 | Determine possible causes and reverse as possible if in keeping with goals of care

- Pruritus should not be considered simply a skin disorder, but rather a systemic problem for which there are multiple causes. It is difficult to isolate these entirely and some degree of overlap is likely.\(^6\)

- Systemic etiology may be present in 4-40% of all cases.\(^6\) Anxiety or fear may be both cause and consequence of pruritus.\(^6\)

- Although it is normal to experience occasional mild or moderate pruritus, the severe pruritus seen in patients with advanced disease is usually associated with uremia (chronic renal failure), cholestasis, opioids, and hematologic disorders; it is a frequent complication of cholestasis.\(^7\) Solid tumours can cause pruritus via biliary obstruction (e.g., in pancreatic cancer). Dry skin also accompanies many of these conditions.\(^8\)

- Opioid-induced itch is due to release of histamines and is more common with spinal opioids than with systemic opioids.\(^8\) May require switching of opioids.\(^31\)
PRINCIPLES OF MANAGEMENT

When considering a management approach, always balance burden of a possible intervention against the likely benefit (e.g., does the intervention require transfer to another care setting?)

- There is no universally effective treatment for palliative care patients due to different pathomechanisms.3,9
- Combinations of systemic and topical agents often provide the best relief.1
- Treatment evidence is stronger for systemic drug therapy than for topical therapy; however, topicals have fewer adverse effects.
- Treatment responses are very individual and cannot easily be predicted.10
- Medications inducing photosensitivity may exacerbate itching; these include: NSAIDS, diuretics, antineoplastics, ciprofloxin.11
- Address other associated cluster symptoms associated with pruritus including sleep, depression and pain.
- A multi-disciplinary team approach is often essential.12,13 Difficult cases require consultation with other medical specialists, e.g., palliative physician and dermatologist.
Non-pharmacological interventions

Interventions available in the home and residential care facilities

- **Tepid baths** with mild, unscented soap can be soothing and temporarily relieve the itch.¹,⁸
- **Add** **baking soda** to late evening bath to form protective layer and maintain hydration.⁴,⁷
- **Dry skin** by gently patting with soft towel or use hair dryer on low setting.⁷
- **Use a “soak and seal” method**: pat skin dry, lubricate the skin with a fragrance-free, cream-base emollient containing camphor or menthol (see pharmacological interventions below).
- **Keep** finger and toe nails **short and filed**.

*Non-pharmacological interventions continued on next page*
Non-pharmacological interventions continued

- Provide cotton gloves for day or night use for those with strong urge to scratch.
- Apply tap water wet dressings (e.g., cotton long underwear soaked in water) to the affected areas several times daily for 1–2 hours for excoriations and crusting due to scratching; provides temporary relief and hastens healing of injured skin.¹
- Loose, cotton clothing is less irritating, minimizes heat retention and sweating.¹
- Avoid fragrant topical agents, perfumes, perfumed soaps.⁸
- Cool packs and loose, light cotton bedding.
- Provide cool humidified environment.²

Interventions requiring additional equipment or admission to acute care

- Ultraviolet B light therapy performed 3 X a week may be useful in pruritus secondary to uremia, cholestasis and malignant skin infiltrations; may not be suitable for terminally ill persons.⁸ Stent placement helps pruritus from cholestasis secondary to pancreatic cancer (to decompress biliary obstruction)¹⁷,¹⁸,¹⁴ and might negate the need for any pharmacologic treatment, eliminating potential adverse side effects of certain drugs.⁸
- Endoscopic or percutaneous biliary tree decompression should be considered in biliary obstruction.¹⁵

Pharmacological interventions (For more detailed pharmacological information, see Medications for management of pruritus)

High quality evidence for interventions in palliative care patients is lacking; the diverse nature and presentation of pruritus hamper studies and drug selection.⁷,⁹

- Antihistamines are generally not helpful, as the role of histamine remains unclear.⁷,⁸,¹⁶
  - Antihistamines value maybe limited to relief via sedation and use at bedtime.⁴,⁹
  - Cetirizine is a very minimally sedating daytime antihistamine.

Pharmacological interventions continued on next page
Pharmacological interventions continued

- **Cholestyramine** is the only drug with a Canadian licensed indication for treatment of pruritus, for use associated with partial biliary obstruction.\(^\text{17}\)

- **Paroxetine**'s effectiveness is cautiously assumed for general palliative pruritus treatment, yet its harm assessment is limited.\(^\text{3,9}\)

- Sertraline at low daily doses can be effective; does not require dose adjustment in renal impairment. Adverse effects may be minimal.

**Topicals**

- Mild to moderate potency corticosteroids (for inflammation), topical anesthetics (lidocaine, prilocaine, pramoxine), doxepin.\(^\text{2}\)

- Cooling products such as menthol (0.25%-2%), camphor (1-3%) are used within emollient compounds.\(^\text{2}\)

- Ketamine (0.5-5%) with amitriptyline (1-2%) in compounded creams.\(^\text{18,19}\)

- Avoid topical antihistamine creams due to risk of allergic contact dermatitis.\(^\text{7,20}\)

**Other**

- Systemic corticosteroids have also been used for cholestatic pruritus.\(^\text{21}\)

- Case reports therapies have included: lidocaine infusion,\(^\text{22}\) ranitidine,\(^\text{23}\) and indomethacin for pruritus in HIV patients.\(^\text{3}\)

**Patient and family education**

- Prevent boredom or anxiety in creative, personalized ways.\(^\text{7}\)

- Avoid vasodilators such as coffee, alcohol, spices and hot water.

- Teach recommended non-pharmacologic strategies.

<table>
<thead>
<tr>
<th>Drug, Action</th>
<th>Indication(s)</th>
<th>Dose, therapeutic range</th>
<th>Adverse Effects, Precautions, Dosing Concerns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cholestyramine (resin binds intestinal biliary acids, interrupts enterohepatic cycle of biliary acids)(^2,7,24)</td>
<td>Cholestasis, Solid tumors and paraneoplastic disorders, Uremia</td>
<td>Initial: 4 g PO taken 30 minutes before breakfast and 30 minutes after breakfast. As needed, add 2 doses at lunchtime (before and after the meal) or at dinnertime (before and after the meal) Maximum: 16 to 32 g/day.</td>
<td>Nausea, constipation, abdominal discomfort, flatulence, unpleasant taste. Often poorly tolerated. Breakfast dosing time effective as pruritogens are stored in the gallbladder overnight. MANY drug interactions, commonly requires dose spacing. Take one hour before or 4-6 hours after other medication to avoid absorption impairment.</td>
</tr>
<tr>
<td>Doxepin [(H1, H2, muscarinic antagonist)](^2)</td>
<td>Cholestasis, Psychogenic</td>
<td>Initial: 10 to 25 mg PO HS Increase by 25 mg/day. Maximum: 75 to 300 mg per day in divided doses.</td>
<td>Drowsiness, xerostomia Powerful H1 effect (more than hydroxyzine or diphenhydramine). QTc prolongation if dose over 100 mg per day.</td>
</tr>
<tr>
<td>Gabapentin (blocks central nociceptive transmissions to brain)(^4,15,16)</td>
<td>Lymphoma, Opioid-induced, Uremia, if failure of other treatments</td>
<td>Initial: 100 mg PO TID. Hemodialysis patients: 100 to 300 mg PO once after HD Pre-op: 1200 mg single dose Maximum: up to 1200 mg/day.</td>
<td>Drowsiness, dizziness, fatigue, ataxia, peripheral edema, visual disturbances, unsteadiness. Adjust dose for reduced renal function. In extended therapy, (optimally) reduce dose over a minimum of one week. Very few drug interactions</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td>Methylnaltrexone (mu opioid receptor antagonist)²⁵, ²⁶</td>
<td>Cholestasis</td>
<td>Initial: 12 mg SC daily Repeat dosing every 1 to 2 days PRN.</td>
<td>Abdominal pain (SC 21-29%), flatulence (13%), nausea (9-12%). Contraindicated in known or suspected GI obstruction or if an increased risk of recurrent obstruction. Costly. Acts peripherally; did not reverse opioid analgesia in two patients.</td>
</tr>
<tr>
<td>Mirtazapine (H₁,5-HT₂, SHT₃ receptor antagonist)², ²⁶</td>
<td>Cholestasis, Lymphoma, Solid tumors and paraneoplastic disorders, uremia if failure of other treatments</td>
<td>Initial: 7.5 to 15 mg PO HS. If partial relief after one week, increase by 15 mg. Maximum: 30 mg/day.</td>
<td>Drowsiness, but may be beneficial for itch suffering at HS. Weight gain. No anxiety or nausea at start of use (unlike SSRI’s). Few drug interactions. Use caution if history of seizures. Discontinuation symptoms have been reported upon abrupt withdrawal; reduce dose gradually if possible. Therapeutic effect may disappear after 4 to 6 weeks. Clearance is reduced in moderate and severe renal function. Administer with caution in hepatic impairment.</td>
</tr>
</tbody>
</table>

<tr>
<td>Naloxone (mu opioid receptor antagonist)², ²⁷</td>
<td>Cholestasis, Opioid-induced, Psychogenic</td>
<td>Initial: 0.2 mcg per kg per minute IV infusion. Double the infusion rate every 3 to 4 hours PRN Maximum: 0.8 mcg/kg/min.</td>
<td>Withdrawal syndrome: if on opioids (reversing analgesia), or if high endogenous opioids (e.g., in cholestasis, liver damage or uremia). May change to PO naltrexone after 24 to 48 hours of use.</td>
</tr>
<tr>
<td>Naltrexone (mu opioid receptor antagonist)², ³, ²⁴, ²⁶</td>
<td>Cholestasis, Psychogenic, Uremia</td>
<td>Initial: 6.25 to 12.5 mg PO daily. Increase by increments of 12.5 to 25 mg BID or TID. Maximum: 300 mg/day.</td>
<td>Vertigo (19-50%) is a major fall risk concern. Dizziness, nausea (29%), abdominal pain, diarrhea, appetite loss, vomiting, arthralgia, anxiety. Withdrawal syndrome; if on opioids (reversing analgesia), or if high endogenous opioids (e.g., in cholestasis, liver damage or uremia) Hepatotoxicity at high doses.</td>
</tr>
<tr>
<td>Ondansetron (5-HT₃ antagonist)¹, ³, ⁶, ²⁴</td>
<td>Cholestasis, Opioid-induced, Psychogenic, Uremia</td>
<td>Initial: 4 mg PO, SC, IV once or twice daily. Maximum: 8 mg TID.</td>
<td>Headache (17%), constipation (11%), diarrhea (16%), xerostomia (5%), increased liver enzymes (17%), fever. Benefit may be ineffective or dose dependent. Single 4 mg IV may be effective for 4 hours; 8 mg IV effective for 16 hours. Costly.</td>
</tr>
